## 1. INTRODUCTION

Baird AE has been retained to prepare an acoustical and vibration report in support of a proposed 16-storey Residential Condominium Development for land located at 696 Chatham Street West in the City of Windsor.

The proposed development will include residential units on a 0.12 ha (0.30 ac) parcel. The development is bounded by a parking lot to the north, Chatham Street to the south, Caron Avenue to the west and mixed-use areas to the east.

The proposed building will be sixteen (16) storeys tall. Floor 1 will have an amenity area, lobby and tenant storage, Floor 2-4 consists of parking spaces, and the rest of the floors (floors 5 to 16) contain the proposed 88 residential units.

The subject property is within 300 meters of a Rail Corridor and Rail Yard, as shown on Schedule F-1 of the City of Windsor Official Plan. Based on Sections 7.2.8.9 and 10.2.11 of the Official Plan, a study is required.

This report will recommend mitigation measures based on criteria set by the Ministry of Environment and Climate Change (MOECC) and the CP railway. Access to the development will be provided from Chatham Street West. The property is shown in Exhibit 1.

**Exhibit 1 - Location Plan**

## **2. NOISE CRITERIA**

The MOECC publication NPC-300 “Environmental Noise Guideline Stationary and Transportation Sources – Approval and Planning” was used in this noise study. Based on the initial investigation, the primary noise affecting the development is from the CP railway corridor and Rail Yard. Air traffic noise was not considered, as the development is located outside the zone of influence of local airports.

Due to the physical features of the surroundings (i.e., a significant urban setting), it is assumed that the development is located in a “Class 1” area defined by MOECC. This class of area has an acoustical environment typical of a major population center during the daytime and night time hours. The “Class 1” MOECC criteria for noise levels resulting from traffic and stationary sources for this development are summarized in Table 1.

**Table 1 – MOECC Noise Level Criteria – (Road)**

Location	Time Period	Noise Levels Requirement
Outdoor - Living Areas	07:00 - 23:00	<55dBA – No Control
		55 to 60dBA – Physical Control or Type A Clause
		> 60dBA – Physical Control and Type B Clause
Outside - Living/dining Plane of Window	07:00 - 23:00	<55dBA – No Control
		55 to 65dBA – Forced Air and Type C Clause
		> 65dBA – Air Conditioner, Type D Clause and Building Components
Outside - Living/dining Plane of Window	23:00 to 07:00	<50dBA – No Control
		50 to 60dBA – Forced Air and Type C Clause
		> 60dBA – Air Conditioner, Type D Clause and Building Components

MOECC Guidelines NPC-300 Section C7.1.1 and C7.1.2 – August 2013

**Table 2 – MOECC Noise Level Criteria – Indoor**

Type of Space	Type of Space	Sound Exposure Level	
		Road	Rail
Living/Dining Room	0700 - 2300	45 dBA	40 dBA
	2300 - 0700	45 dBA	35 dBA
Sleeping Quarters	0700 - 2300	45 dBA	40 dBA
	2300 - 0700	40 dBA	35 dBA

MOECC Guidelines NPC-300 Section C3.2.3 – August 2013

Table 2 describes indoor sound level limits that are used to calculate the Sound Transmission Class (STC) should outdoor sound level limits be triggered for building components.

**Table 3 – MOECC Noise Level Criteria – Stationary**

Time Period	Outdoor Points of Reception	Plane of Window
0700 - 1900	50 dBA	50 dBA
1900 - 0700	45 dBA	45 dBA

Source: MOECC publication NPC-300 "Sound level limits for Stationary Sources in Class 1 & 2 Areas (Rural)", Tables C-5, C-6; August 2013.

Due to the 300m proximity to the railway corridor and yard, stationary sources limits are considered and limits are provided in Table 3. Indoor sound level limits are used to calculate Sound Transmission Class (STC) when stationary sources are available. Exhibit 2 depicts the railway proximity in relation to the subject property.

**Exhibit 2 – Railway Proximity Map**

## 2.1 Receiver Locations

The sample receiver locations were identified and are located at the worst-case locations (most exposed) for both day and nighttime noise. For daytime, receivers are placed 1.5m above ground (floor) and for nighttime receivers are placed 4.5m above ground.

For indoor living areas, the plane of window (POW) will be used to represent the worst case for both daytime and nighttime receivers.

The term “outdoor living area” (OLA) is used to refer to an outdoor patio, a backyard, a terrace, balconies or other areas where passive recreation is expected to occur. A review of the site plan indicates that the proposed building will have a 5<sup>th</sup> Floor Amenity Deck. The amenity space depth is more than 4m which is considered an OLA. It is noted that the dwelling units will have private balconies under 4 meters in minimum depth and aren’t considered OLA’s, as per the Ministry guidelines.

Table 4 identifies the various receiver heights chosen as the “worst case” locations within the proposed development. These locations are shown in Appendix A, Figure 1.

**Table 4 – Receiver Locations**

Receiver Location	Height of Receivers		Represents
	Grade (m)	Type	
Receiver OLA – Floor 5	15.2m	OLA	West facades
Receiver – Floor 5	15.2m	POW	South, West facades
Receiver – Floor 6	19.4m	POW	South, West facades
Receiver – Floor 7	22.4m	POW	South, West facades
Receiver – Floor 10	31.6m	POW	South, West facades
Receiver – Floor 14	43.4m	POW	South, West facades
Receiver – Floor 16	49.8m	POW	South, West facades

## 2.2 *Stationary Noise Source*

A review of all surrounding users was conducted and two properties were identified as being potentially significant noise sources, namely:

CP Railway Corridor and Railway Yard – to the southwest of the subject property: the yard is within a 300m buffer area and it operates 24/7 with continuous operations.

Ambient noise levels at both monitoring locations are dominated by traffic noise from University Avenue. Whereas no significant noise was observable except for hydraulic brakes from the stationary noise sources despite the proximity of the CP yard.

Noise level monitoring was conducted on November 22, 2022 (weekday) at 3:30 pm for 20 minutes at two locations. Measurements were taken using an Extech Noise Meter model 407780A noise monitoring device. The sound levels were measured at a height of 1.5m above the ground. The following measurements were taken:

- a) The first measurement was taken on the subject property at the northeast corner of Caron Avenue and Chatham Street West.
- b) The second monitoring location was 55m from the intersection of Caron Avenue and Chatham Street West. The monitored noise level was 56.4 dBA.

## 2.3 *Noise Environment*

In order to obtain the current noise level, noise level monitoring was conducted at two locations on Tuesday, November 22, 2022, for 20 minutes. Measurements were taken using an Extech Noise Meter model 407780A noise monitoring device. The sound levels were measured at a height of 1.5m above the ground. The equivalent sound pressure level (Leq) at the monitoring locations is provided in Table 5 and shown in Appendix A, Figure 1.

**Table 5 – Transportation Noise Level**

<b>Receiver Location</b>	<b>Monitoring Level Daytime (dBA)</b>
Monitoring 1	53 (avg) – 66.4 (max)
Monitoring 2	56.4 (avg) – 73.3 (max)

The noise propagation analysis was completed using the noise modelling program “iNoise”, produced by DGMR Software to match the monitoring noise levels at monitoring locations M1 and M2 from surrounding sources. The iNoise program follows International Standards Organization (ISO) standards 9613 parts 1 and 2. The model is capable of incorporating various site features such as elevations, berms, absorptive grounds and barriers to accurately predict noise levels at specific receptors, pertaining to noise emission from sources. The model is considered conservative since it represents the atmospheric condition that promotes the propagation of sound from the source to the receiver.

The following assumptions were used in the iNoise modelling:

Reflections: A building reflection of 0.8 was assumed to be representative of the brick façade present for the surrounding building including the proposed building.

Ground Absorption & Topography: A ground absorption coefficient of 0 was used to represent the most reflective (i.e., paved surface) The area surrounding the monitoring location is characterized by generally flat. As such, topography was not incorporated into the noise modelling.

The potential significant noise sources associated with rail and roadway sources have been assumed as well. Details are provided in Appendix A. The following potential stationary and transportation noise levels were established for iNoise software:

- The Locomotive Diesel engine noise level is 99.2dBA.
- The hand-held hydraulic brake noise level is 111.2dBA.
- Rail whistle noise to be 115dBA.
- Roadway car noise level is 79.2dBA at 50km/h speed.
- Slow moving truck noise level is 95.4dBA.

### **3. NOISE ASSESSMENT**

Overall unattenuated daytime and nighttime sound levels at the receiver locations are shown in Figure 3 and are described in Table 6.

**Table 6 – Post Development Predicted Noise Levels**

Location	Noise Level (dBA)			MOECC Criteria (dBA) Rail	Meets MOECC
	Receiver 1	Receiver 2	Receiver 3		
Floor 5 OLA Daytime	38	--	--	60	Yes
Floor 5 Daytime	53	53	53	40	No
Nighttime	49	49	50	35	No
Floor 6 Daytime	52	52	52	40	No
Nighttime	49	49	49	35	No
Floor 7 Daytime	52	52	52	40	No
Nighttime	49	49	49	35	No
Floor 10 Daytime	52	52	52	40	No
Nighttime	49	49	49	35	No
Floor 14 Daytime	52	52	52	40	No
Nighttime	49	49	49	35	No
Floor 16 Daytime	52	52	52	40	No
Nighttime	49	49	49	35	No

Based on predicted sound levels as shown in figures 2 and 3 (Appendix B) and table 7, mitigation measures are required, such as warning clauses, required to meet the MOECC Limit of 40dBA daytime and 35dBA nighttime. Mitigation measures are provided in Section 4.

For indoor living and bedroom areas, daytime and nighttime noise levels are above 40 dBA during daytime and 35 dBA at nighttime for all receiver locations, therefore, an assessment of glazing requirements is necessary to meet the indoor sound levels for buildings at all receiver locations.

## 4. MITIGATION MEASURES

### Acoustical Fence

No acoustical fence is needed as the noise level is less than 60dBA for the OLA for common balconies on the 5<sup>th</sup> floor.

### Building Components

To calculate the required building components, the dimensions of the rooms and their wall/window sizes must be known. Table 7 summarizes the building component areas.

**Table 7 – Building Component Sizes**

South, West Façade	Window	Door	Floor
Bedroom	3.3 m <sup>2</sup>	2.3 m <sup>2</sup>	8.7 m <sup>2</sup>
Living room	3.3 m <sup>2</sup>	2.3 m <sup>2</sup>	11.7 m <sup>2</sup>

Detailed calculations are included in Appendix D, and Table 8 summarizes the required STC values for the various façades. Sample building components and their associated STC ratings are included in Appendix D.

**Table 8 – Required STC Values (Window/Door)**

Location	Type	South Façade	East Façade	West/North Façade
Level 6 - 10	Bedroom	36	35	36
	Living	29/30	27/29	29/30
Level 10 - 16	Bedroom	35	34	34
	Living	28/30	27/29	27/30

It is also recommended that an acoustical consultant review the building components to ensure that noise levels satisfy the requirements, as stated in Table 8. For the proposed development, the estimated building components are shown in Appendix B, Figure 1.

The Ontario Building Code (OBC) section 5.8.1 specifies the minimum required sound insulation characteristics for partitions in terms of Sound Transmission Class (STC) values.

For acoustic privacy in a multi-tenant building between suites, the inter-unit wall should meet or exceed STC-50. Walls separating suites from noisy spaces, such as refuse chutes or elevator shafts, should meet or exceed STC-55. In addition, it is recommended that the separation of suites from any amenity or commercial space for building component (floor/ceiling) construction also meet or exceed STC-55.

## 5. VIBRATION MONITORING

Vibration measurement was completed on November 22, 2022, and the location is labelled VIB A in Appendix A, Figure 1. The vibration analyzer SSEYL Landtek VM3670 was securely placed on top of the concrete surface to measure the ground vibration generated by light and heavy vehicles. Details are provided in Appendix B. Vibration ranges are:

- Velocity: 0.01 to 0.69 mm/s
- Displacement: 0.002mm to 0.025mm
- Acceleration: 0.00 mm/s<sup>2</sup>

It is therefore recommended that the building design incorporate the maximum vibration parameters in addition to the requirements of section 4.1.3.6 of the OBC.

## 6. RECOMMENDATIONS

As demonstrated in this report, mitigation measures are required to bring residential units within the development into compliance with MOECC criteria. With the inclusion of these measures, MOECC noise criteria will be satisfied.

### **Recommendation #1 (All Units Within Developments)**

Due to the exceedance of the MOECC criteria for daytime and nighttime acoustical levels from CP Rail Corridor and Rail Yard, the units are to be equipped with air conditioning and forced air heating. Further, these units shall include the following warning clause:

"Due to its proximity to Chatham Street West and CP railway, these dwelling units has been supplied with a central air conditioning system which will allow windows and exterior doors to remain closed, thereby ensuring that the indoor sound levels are within the sound level limits of the Municipality and the Ministry of the Environment, Conservation and Parks."

## **Recommendation #2 (All Units Within Developments)**

A noise warning clause should be included in the property and tenancy agreements and offer of purchase and sale for the dwelling units to inform the future owners/occupants of the noise issues and the presence of the existing facilities, and that sound from these facilities may at time be audible during a period of low background sound and which read as follows:

"Purchasers/tenants are advised that due to the proximity of the adjacent roadway and CP facility, noise from the railway may at times be audible."

## **Recommendation #3 (Building Components)**

Due to exposure to train noise, the units facing south, west and north facades require special building components for areas of sensitive use (i.e., bedroom, living room, dining room, kitchen, etc.) and the following are required:

### Window Requirements:

All windows leading to sensitive living areas are to have a minimum Sound Transmission Class as provided in Table 8 in order to meet the MOECC indoor noise level criteria.

### Door Requirements:

All doors leading to sensitive living areas are to have a minimum Sound Transmission Class as provided in Table 8 in order to meet the MOECC indoor noise level criteria.

### Wall Requirements:

Acoustic privacy between units in a multi-tenant building, the inter-unit wall, should meet or exceed Sound Transmission Class 50. Wall separation between noisy spaces, such as refuse chutes or elevator shafts, and suites should meet or exceed Sound Transmission Class 55.

Further, these units shall include the following warning clause in the purchase or lease agreements:

"Purchasers/tenants are advised that due to close proximity of the adjacent industries, noise from said industries may at times be audible."

**Recommendation #4 (All units within the development)**

Prior to the issuance of building permits, it is recommended that an acoustical consultant review the Sound Transmission Class for the proposed development's walls, windows and doors to ensure they conform to the recommendations outlined in this report.

**Recommendation #5 (All units within the development)**

The design of the building should consider the monitored vibration values in addition to those provided in section 4.1.3.6 of the Ontario Building Code.

**7. SUMMARY**

We conclude that this development can, with the implementation of the above-described mitigation measures, be designed to address impacts from the surrounding noise sources.

If you have any questions or wish to discuss our findings, please advise us.

Yours truly,

**BAIRD AE INC.**
