Re: Application of Florid in City Water Supply

Dear Beth Toldo

I am in favour of continuing the practice of adding florid to our Windsor water supply , in the reasonable amounts , as indicated by the Health department.

My reasons are as follows:

It is my understanding that this product helps to reduce tooth decay , and helps harden tooth enamel .

I have in my short life lived in areas where florid was added to the water and other areas where it was not . The result I found was that a year or two after I had lived in an area where florid was present in the water my dental bill significantly reduced. I have not been able to find any other reason for this.

I understand this practice has been going on for six or seven decades at a very small cost : with no known medical reports of any health problem.

I have heard of some studies that may suggest that florid is not beneficial to our health are under way but as yet are incomplete at present . They should not be considered in regard to florid use : until the final reports are available.

I am also a taxpayer and live in the city of Windsor.
